

## A knob-based query interface for ISNM digital library

Below is the sketch of the tangible query interface.

The main idea is to have a knob which should act as a rheostat for all the available services. By simply rotating the knob a user could select which service he would like to be performed.

The services could be renting, returning or simply viewing information about a particular document. The information is displayed on a screen as shown below. Between the tangible query and the display unit there is a sophisticated processing unit encompassing computers and all the necessary connection interfaces.
